COVER STORY & FEATURES

- 06 Why We Want to Change - and Why We Don't**
The gap between deciding and doing, and the second Tuesday where it shows.
- 11 Marks, Money or Meaning?**
A prize withdrawn, and the middle of the class that stopped working for it.
- 32 The Motivation Machine**
The centre spread: every part of the loop, and where each one breaks.
- 34 When Motivation Dies After Failure**
Two students, one mark, two directions - and what separates them.

ALSO IN THIS ISSUE

- 04 What Actually Makes You Move?**
The October editorial.
- 15 The Confidence Engine**
Why encouragement bounces, and what actually builds the private estimate.
- 19 The Psychology of Procrastination**
Tomorrow always looks like a better day. It is the same day.
- 24 From Dream to Drive**
Turning a wish into something that changes a Tuesday afternoon.
- 29 Everybody Is Ahead of Me**
Their finished results against your unfinished one.
- 39 New Chaitanya High School**
Four pages inside one school year, in the school's own words.
- 43 Gen Z in Action**
SL Radio and the English workshops, in photographs.
- 51 The First Year After the Big Change**
The term where the costs are visible and the returns are not.
- 55 The Parental Push**
Same words, same tone - and two children who hear opposite things.
- 59 The Magic of Mathematics**
Guest article: Tadeppally Lakshmi Bhavani on the pattern underneath.
- 61 Articles by Students**
J. Ananya, Y. Yeshaswini and K. Lasya, in their own words.

OPENING FEATURE

Why We Want to Change – and Why We Don't

A student can want something sincerely, describe it in detail, and still not move towards it for a year. That gap is not a character flaw. It is the most ordinary finding in the psychology of motivation, and nobody ever explains it.

THE GENZ TIMES

Every student in this photograph can name what she wants to become. The distance between that and Tuesday evening is what this issue is about.

Ask a class of sixteen-year-olds what they want to become and you will get answers immediately. Doctor. Civil servant. Software engineer. Lawyer. The person who starts a company nobody has thought of yet. The answers come fast, they come with detail, and in most cases they are completely sincere. Ask the same class what they did about it yesterday and the room changes temperature.

This is not hypocrisy and it is not laziness, though both words get used. It is the single most reliable finding in the study of human motivation, and it has a plain name: the gap between intention and behaviour. People who genuinely intend to do something do it far less often than they expect to, and they are consistently surprised by this about themselves. Not once. Every time.

What makes it worth a magazine article rather than a shrug is that the gap is not random. It is patterned. It widens

and narrows for reasons that can be described, and once a student can see the pattern, she stops interpreting her own behaviour as evidence of a defect. That change alone is worth more than most of the advice she will be given this year.

WANTING IS NOT ONE THING

Start with the word itself. When a student says she wants to become a doctor, she may be describing any of four quite different states, and they behave differently.

She may be describing a picture: herself in a coat, her parents at a convocation, a version of her life she finds pleasant to imagine. Pictures are powerful and they are not plans. Nothing in a picture tells you what to do on a Tuesday.

She may be describing an escape. Medicine is a way out of a town, or out of a family business, or out of being the child who was not exceptional at anything.

She may be describing an inheritance – a parent's profession, or a parent's unfinished ambition, carried forward without anybody naming it as such.

Or she may be describing a commitment: a thing she has decided, whose costs she has looked at, and which she is prepared to keep choosing on days when it is not enjoyable.

THE COST OF A FIRST STEP IS NOT THE COST OF THE STEP

The second reason the gap exists is that beginning is priced wrongly by the mind.

The explanation is that the first step is never priced as an action.

THE THIRD MECHANISM IS ARITHMETIC

The last of the three is the one that does the most damage and gets discussed the least, because it does not sound like psychology.

A student is asked to work today for an outcome three years away.

THE REMOVAL TEST

- Ask of any reward in your school or home: if this stopped next month, what would remain?
- If effort would collapse, the reward has been carrying the explanation for why the work matters. That is a fragile arrangement, not a successful one.
- External reward is fast, reliable, decays on removal, and narrows behaviour towards what is measured.
- Internal reward is slow, unreliable, does not decay, and generalises to what nobody measured.
- The error is not using external reward. It is using it as the only answer to the question of why any of this matters.

The removal test above is worth running literally rather than as a thought

experiment, and it is uncomfortable in most institutions. Take each visible reward – the monthly ranking, the topers' board, the certificates, the prize-day list – and ask what would be left if it went. Then ask the harder second question: what is currently carrying the explanation for the students who never appear on any of them, which in most schools is four children in five.

THE CASE FOR MARKS, HONESTLY PUT

It would be easy to finish an article like this with a case against marks, and it would be dishonest, so here is the case for them.

The problem has never been that marks exist. It is that they have been asked to do a second job they are unsuited to – supplying the reason – and a third job they are actively bad at, which is summarising a person. A mark is information about one performance on one day against one paper. Treated as that, it is useful and largely harmless.

Treated as a verdict on a child, it produces exactly the avoidance described on page 6.

There is one more thing marks do that deserves defending, because the alternative is worse and is often proposed by people who dislike examinations. A mark is impersonal. It does not know whose child you are, whether the teacher finds you likeable, or how well you speak. In a system with a great deal of informal advantage running through it, an impersonal measure is a protection, and the students it protects are the ones with the least of everything else.

Replace it with continuous assessment of attitude and effort and you have replaced a flawed objective measure with judgements that will track family background far more closely than any paper did. This magazine has argued that schools should measure more than marks, never that judgement should quietly replace evidence.

The result comes home, and the child's first thought is not about the subject.

A WORD TO PARENTS ABOUT THE REWARD AT HOME

Everything above applies to the household, where the reward structure is usually stronger than the school's and almost never designed. Most families operate an informal exchange rate – a result buys a phone, a rank buys a trip, a poor term costs something – and it is worth knowing what that arrangement teaches.

WHAT WE WOULD ASK A SCHOOL TO CHANGE

- Publish less. A ranking read to an assembly informs the top five and withdraws the middle forty. The same information delivered privately does the first without the second.
- Praise the method, not the person. Same quantity, different aim. It is free

and it takes a fortnight to become habit.

- Give every student at least one place where the work is at the edge of what she can do, rather than far beyond it. For a student who is behind, that will not be the syllabus.
- Offer small choices constantly. Which question, which order, which example. The cost is nothing and the effect is measurable in a single lesson.
- Never let the reward carry the explanation. If a child cannot say why the work matters without mentioning a prize, a rank or a parent, something has been left undone.

WHAT WE ARE NOT SAYING

This magazine is read by families who are, in many cases, one generation away from not having had these choices at all, and there is a version of this argument that is easy to write from a

comfortable chair and insulting to them. The version that says marks do not matter, that a child should follow her interest, that the examination is a distraction from real learning. It is advice that is only safe for people with something to fall back on.

Marks matter. The argument is narrower and, we think, harder to dismiss: that a student who has some reason of her own as well will score at least as well as one who does not, will survive the bad terms better, and will still be able to work in the second year of a degree when nobody is checking.

None of this requires abolishing anything, and that is deliberate.

The question this article has been circling is on the cover of this issue in a different form.

FEATURE

The Psychology of Procrastination

Why does tomorrow always look like a better day to begin? Not a time-management article - September did that thoroughly. This is about what the mind is actually doing when it postpones something it has decided to do.

THE GENZ TIMES

The evening did not go anywhere. It went into a tidied room, a rearranged shelf and a squared-up stack of books, and at no point did it feel like avoidance.

A student sits down at eight to study physics. At twenty past eight the desk has been cleared, the pens sorted, a glass of water fetched, three notifications answered and the timetable for the week redrawn in a better colour. At nine she has not read a page, and the strange part is that she has not been idle for a single minute of that hour.

Everything she did was useful, small, and somehow more available than the thing she sat down to do. That is the shape of procrastination and it is worth noticing, because it rules out the two explanations usually offered. She was not lazy, since she worked steadily for an hour. She was not undisciplined, since everything she did was orderly. Something specific was blocking one particular action while leaving all the others perfectly accessible.

NOT A TIME PROBLEM

September spent several pages on where a student's hours go, and it will not be repeated here, because this is a different problem that happens to look the same from outside. A student who does not have enough hours has a scheduling difficulty. A student who has the hours, has cleared them deliberately, and still does not begin has something else going on, and no timetable ever invented addresses it.

The evidence for the distinction is in what happens when you give a procrastinating student more time. Almost nothing. The deadline moves, the avoidance moves with it, and the work still happens in the last available window. If time were the constraint, added time would be spent. It is not spent, which means time was not the constraint.

There is a further piece of evidence that settles it. Ask a procrastinating

student to describe, in detail, the twenty minutes before she does not start. Almost every account contains a moment of deciding to begin shortly, followed by a small legitimate task, followed by another. Nobody in these accounts ever decides not to work. The decision that is actually taken, many times over, is to work in a few minutes, and each of those decisions is individually reasonable.

THE THING THAT IS NOT BEING SAID

Before going further it is worth naming what students almost never say out loud about this, because it is the part that carries the shame and the shame is doing real damage.

That belief is worth examining for one reason above all others: it is itself a cause.

What Happens Inside Your Mind When You Decide to Do Something

Seven stages, in order. Every one of them can be interrupted, and every interruption looks from outside like a student who is not trying.

FOUR THINGS THIS DIAGRAM IS SAYING

- The feeling arrives after the work starts, not before it
- Confidence is made of evidence, and evidence only comes from attempts

THE ONE FINDING: the feeling arrives after the work starts · beginning is

- Beginning is expensive because it delivers a verdict, not because it costs effort
- Every stage can be interrupted, and every interruption looks like laziness

expensive because it delivers a verdict • confidence is made of evidence

SCHOOL PROFILE

Where Education Goes Beyond the Classroom

A journey of learning, achievement, teamwork, values and the making of confident young minds. New Chaitanya High School, Abdullapurmet, Hyderabad.

NEW CHAITANYA HIGH SCHOOL • ABDULLAPURMET, HYDERABAD

Satyameva Jayathe. The school's own crest, carrying a figure climbing towards a rising sun.

The campus at Abdullapurmet: several levels, broad balconies, and the physical growth of an institution.

There is a moment in every child's life when school becomes much more than a place to attend classes. It becomes the place where friendships are formed, confidence begins to take shape, talents are discovered, mistakes are made and corrected, victories are celebrated, and the first dreams about the future begin to take form. For parents, choosing such a place is therefore never simply a matter of choosing a building or a curriculum. It is about choosing an environment in which their child will spend some of the most formative years of life.

At New Chaitanya High School, Abdullapurmet, Hyderabad, education is reflected not merely through what happens inside a classroom, but also through the opportunities children re-

ceive to participate, compete, perform, collaborate and develop values. The school's recent academic achievements, sporting accomplishments and family-oriented activities together present a picture of an institution that seeks to make school life a meaningful experience for its students.

The school building itself makes a distinctive visual statement. Rising across several levels, with its broad balconies, classrooms and open spaces, the campus reflects the physical growth of an institution that is part of a developing educational landscape. Yet, as every educator knows, a school is ultimately not defined by its walls.

And that is where the story of New Chaitanya High School becomes particularly interesting.

THE MARKS ARE IMPORTANT. BUT THE JOURNEY BEHIND THEM MATTERS MORE.

"A school is ultimately not defined by its walls. The true identity of a school lives in its students."

NEW CHAITANYA HIGH SCHOOL

What follows is the school's own account of its year, printed as given.

A NOTE ON THIS PROFILE

This magazine has argued across three issues that a school should be judged on what it makes possible rather than on what it advertises.

What a reader can do with it is what a reader can do with any prospectus: look at what the institution chose to lead with.

New Chaitanya High School is in Abdullapurmet, on the eastern edge of Hyderabad, and admissions for the coming academic year are open as this issue goes to press. It is the school's own account of its year, and it is

printed here as the school gave it to us. Schools wishing to be featured may write to editor@saaradaa.com.

WHAT A MARKSHEET DOES NOT CONTAIN

Every parent understands the importance of academic performance, and every student who works towards an examination knows the discipline that achievement demands. Behind every high score are hours of preparation, revision, practice, concentration and perseverance. A marks sheet may contain only a few numbers, but those numbers often represent months and years of effort.

A child who learns to prepare systematically for an examination is learning discipline. A student who struggles with a difficult subject and continues working is learning perseverance. A young learner who makes mistakes, understands them and tries again is learning something that no textbook can teach in isolation: the ability to keep moving forward.

This is why academic achievement is best understood not simply as a final score, but as evidence of a journey.

A CHANGING WORLD

The educational world that today's students are entering is changing rapidly. Information is everywhere. Technology has transformed the way students access knowledge, communicate and learn. In such an environment, schools have an increasingly important responsibility - not merely to help students remember information, but to help them understand it, communicate it, apply it and develop the confidence to use what they know.

That responsibility is easier to state than to discharge. A school can install a computer laboratory and change very little; it can change the way a teacher hands back a piece of work and change a great deal.

PHOTO ESSAY

Gen Z in Action

Voices. Classrooms. Conversations. Confidence. Four pages from SL Radio and the English workshops, after thirty pages of argument about what happens inside a student's head.

SAARADAA LEARNOWATIONS PVT. LTD.

On air at the console, New Chaitanya High School. The outcome is uncertain, the result arrives within minutes, and a poor broadcast is survivable – the exact combination an ordinary school week does not supply.

The preceding thirty pages have been an argument, and arguments are easy to agree with and hard to picture. These four pages are what the argument looks like when it is happening in a room in Telangana on a Tuesday afternoon.

WHAT SL RADIO IS FOR

A student at a microphone has taken on a task with a genuinely uncertain outcome in front of an audience, which page 15 identified as the only transaction that produces real self-belief. Three properties make it work: it is uncertain, it resolves within minutes, and it is cheap to fail at. A worksheet has none of the three.

The install, August 2026. A station is a desk, a laptop, a microphone and an afternoon of somebody configuring it.

The finished desk, waiting for its first student.

OBJECTIVES

- Give every student a place in the week where she speaks and is heard.
- Make the result arrive within the hour, not at the end of a term.
- Keep the stakes on any single broadcast low enough that a poor one is survivable and the next one still gets attempted.
- Put the equipment in the students' hands – scripting, timing, running the console – rather than in a teacher's.

The photographs across these four pages are of real sessions in real schools, published with the permission of the schools and of the families of the students in them. Nobody in them is a model and nothing was arranged for the camera, which is why several are less flattering than a staged photograph would have been. A photograph of a classroom in which everybody is smiling at the camera tells a reader nothing about the room.

The station on these pages was installed at New Chaitanya High School in August 2026 – the same school profiled on the preceding four pages. The photographs are of the install and the handover, because that is the part nobody usually photographs, and because a station is a good deal less impressive-looking than what eventually comes out of it.

What a station actually consists of is a desk, a laptop, a microphone, a pop filter and somebody willing to spend an afternoon configuring it. The equipment is not the difficult part and never has been. The difficult part is the timetabled hour afterwards that nobody is allowed to move.

Whether a school gets anything out of it is decided in the weeks after the engineers leave, and depends almost entirely on whether somebody in the building defends that hour when the examination term arrives.

A station reaches the whole school at once, which is its other advantage. A student who would not read aloud to thirty classmates will sometimes speak to four hundred, because the four hundred are not in the room and cannot see her hesitate. Nothing in the room was arranged for the camera. Nothing in these pictures was arranged for the camera.

WHAT IT COSTS A SCHOOL TO START ONE

Less than most schools expect, and almost none of it is equipment. A room that can be made quiet, a laptop, two microphones, and an hour in the timetable that nobody is allowed to move. The hour is the part schools find hardest to give and the part that decides whether the station survives its first term.

The failure mode is always the same. A slot that can be borrowed back whenever an examination approaches is not a slot, and the students work that out inside a month.

The schools that get the most out of it treat the broadcast as a deadline rather than a performance.

A station that has run for a year stops needing us at all, which is the point.

An English workshop in session. Active rather than attentive – a room where people are arguing about a text.

WHAT THE ENGLISH WORKSHOPS ARE FOR

A student who cannot read a dense passage and extract exactly what it says is locked out of every route on September's crossover map, whatever her marks in any subject. Civil services, law, the accountancy qualifications, management, most public sector recruitment – every one of them gates candidates on the same underlying operation in different clothing. The subject matter varies. The operation does not.

That capability is treated in most schools as a property of the English period, which is roughly like treating arithmetic as a property of the mathematics period. It is the medium the rest of the curriculum is conducted in, and a student who is weak in it will appear weak in subjects she is perfectly capable of.

A passage being argued over. Nobody in this photograph is being quiet and attentive, which is the point.

The facilitator with one student. The programme's own measure of whether it worked is whether the school's teachers carry it on.

OBJECTIVES

- Read something unfamiliar and dense, under time, and say what it actually says rather than what you expected it to say.

- Build the two hundred words a discipline uses without explaining.
- Make being wrong about a passage ordinary, so that attempting one is cheap.
- Hand the method to the school's own teachers, so the work continues after the sessions end.

The reason the English work sits at the centre of what this organisation does is not that language matters more than mathematics. It is that comprehension is the one capability whose benefit shows up inside every other subject, and the one where a late intervention still changes something for a sixteen-year-old who has already been written off.

WHY ENGLISH RATHER THAN ANOTHER ROUND OF SUBJECT COACHING

A question this organisation is asked constantly by schools, usually in the form of whether the same effort would be better spent on mathematics or science.

The answer is about transfer. Additional mathematics teaching produces additional mathematics, which is valuable and is confined to mathematics. Comprehension transfers into every subject a student studies in English, which in most of these schools is all of them, and into every competitive route afterwards.

There is an equity argument too, and we make it less often because it is uncomfortable. The students in any classroom who read fluently are disproportionately the students with books at home and parents who read. The gap that opens between them and the rest is read by everybody, including the children, as a difference in intelligence. It is not. It is a difference in hours of exposure, it is visible by Class IV, and it is one of the few gaps in Indian schooling a school can actually close with an intervention it can afford.

What we can claim for a term of workshops is that students who were unwilling to attempt an unfamiliar passage become willing to attempt one. What we cannot honestly claim is a specific improvement in board results attributable to the programme: too many things move at once in a school year, the students who join are not randomly selected, and any number we produced would be the kind of figure this magazine criticised on page 5.

We would rather say that plainly than publish a number, and a school considering the programme should ask every provider it talks to for the same distinction between what changed and what can be attributed. It is the question we would want asked of us. Every provider a school talks to should be asked to make the same distinction, and most will not.

What we can describe is what changes while the sessions run, because that part is observable in the room. Students who would not attempt an unfamiliar passage in week one attempt one in week six. Teachers tell us the same students begin asking about words rather than skipping them.

Whether any of that survives the year depends entirely on what happens after we leave, which is why the fourth objective listed above matters more than the other three put together. A programme that leaves nothing behind in the staff room has not finished its work.

WHAT A SESSION ACTUALLY LOOKS LIKE

Not a lecture. A passage nobody in the room has seen before goes up, and the first question is what it says rather than what it means – which sounds trivial and is where most of the difficulty sits. Students who are used to being asked for the theme of a poem find it genuinely hard to report what a sentence actually claims, because nobody has ever asked them to.

Then disagreement, which is the part that has to be engineered. A room in which two students read the same paragraph differently, and have to say why, is doing the work. A room in which everybody agrees with the facilitator is not, however attentive it looks from the door.

The sessions are deliberately short and deliberately frequent. Comprehension is a habit rather than a body of content, and a habit responds to forty minutes a week for a term far better than to a workshop day that everybody enjoys and nobody repeats.

Forty students a term is the realistic figure for one facilitator, and we would rather say that than imply a whole year group can be reached at once. What reaches the year group is the teacher who sat in and kept going.

The reading itself is the intervention. Everything else is scaffolding around getting a student to attempt an unfamiliar page.

SAARADAA

Bringing the change you wish for

TWELVE ISSUES A YEAR

Have It Delivered

The GenZ Times is published monthly for students, parents and the people who run schools. A subscription puts every issue in your hands – or in your school library – without anybody having to remember to order it.

WHAT YOU GET

- Twelve issues, posted to you each month.
- Sixty-four pages an issue, full colour.
- Every article written for this magazine – not syndicated.
- School and library rates for bulk orders.
- Back issues available while stocks last.

Scan to subscribe

store.theslpl.in/subscribe

Or write to editor@saaradaa.com and we will set it up for you.

FOR SCHOOLS AND LIBRARIES

Bulk rates for staff rooms, libraries and reading programmes, and a single invoice for the year. Tell us how many copies and which address, and we will do the rest.

NOVEMBER

What a student should be moving towards: the skills that survive the next decade.

DECEMBER

Reading, and why the students who read are pulling further ahead than they were.

JANUARY

What employers in Hyderabad actually test for, and what a school could do about it.

The Magic of Mathematics

More than numbers, formulas and answers – a language, a way of thinking, and an invisible thread running through much of the world around us.

Tadepally Lakshmi Bhavani

Subject Matter Expert – Mathematics

What comes to your mind when you hear the word Mathematics? For some, it immediately brings back memories of numbers, formulas, calculations and examinations. For others, it may awaken curiosity – the excitement of discovering a pattern, solving a puzzle or finally arriving at an answer after several attempts. But mathematics is much more than what we see in a textbook. It is a language, a way of thinking and an invisible thread that runs through much of the world around us. Mathematics is not merely something we learn; it is something we live.

We use mathematics from the moment we wake up. We look at the time, plan our day, measure ingredients while cooking, calculate expenses while shopping, compare prices, estimate travel time and manage our savings. Architects use

geometry to design buildings, engineers use mathematics to create bridges and machines, and scientists use mathematical models to understand nature and the universe. Today, even smartphones, artificial intelligence, digital communication and countless technologies that have become part of our daily lives depend heavily on mathematics.

Yet perhaps the most beautiful mathematics is the mathematics we can discover in nature. Look closely at a sunflower and notice the patterns in its centre. Observe the symmetry of a butterfly, the spiral of a seashell, the arrangement of leaves on a plant or the repeating patterns in crystals. These are not merely beautiful decorations; they reveal relationships, structures and patterns. Nature does not always announce that it is doing mathematics, but mathematics helps us recognise the order within it.

The patterns in a sunflower's centre, the symmetry of a butterfly, the spiral of a shell. Nature does not announce that it is doing mathematics.

“Nature does not always announce that it is doing mathematics, but mathematics helps us recognise the order within it.”

TADEPALLY LAKSHMI BHAVANI

For many learners, however, the greatest challenge in mathematics is not mathematics itself, but the fear associated with it. A concept introduced too quickly, a mistake made in

front of others or constant comparison with classmates can gradually create the belief, I am just not a maths person.

One of the greatest gifts mathematics offers us is not the ability to calculate quickly, but the ability to think logically. Whether we are making a decision, analysing information, planning a project or solving an everyday problem, logical thinking helps us approach situations with greater clarity. These skills extend far beyond the mathematics classroom. Logical thinking helps us approach situations with greater clarity.

STUDENT VOICES

Articles by Students

Two pages given over to students, in their own words. We do not correct the voice out of a piece before printing it.

For most of Class VIII I was waiting for something. I had decided, without ever putting it to myself in those words, that at some point I would feel like studying - that the mood would arrive, the way it seemed to arrive for the people who were doing well, and then the rest would become straightforward.

It did not arrive. What arrived was February, and a set of marks I did not show anybody at home for four days.

The thing that changed was not dramatic and I am slightly embarrassed by how small it was. A teacher asked me what I had done the previous evening. Not what I had scored, and not why I had not worked. What I had done. I said I had planned to start at seven and had not started. She asked what I had been going to start with, and I could not tell her. I did not know. I had been planning to study biology, which is not a thing anybody can start doing at seven o'clock.

That was the whole conversation and it took about four minutes. What I took from it was that I had never once decided what the first fifteen minutes of an evening would actually contain, and I had spent a year blaming myself for not wanting it enough.

Now I write down one thing. Not a timetable - I had made a great many timetables and they were, I now understand, a way of spending an evening near the subject without doing any of it. One thing, specific enough that I could begin it without deciding anything further. Read two pages of the chapter on respiration. Do the first six questions.

I still do not feel like studying. I want to be honest about that, because everything I had read before suggested that at some point the feeling shows up and carries you. It does show up. But it shows up about twenty minutes after I start, which is no use at all as a reason to start. I had the order backwards for a year.

The other thing I would say to anybody in Class VIII or Class IX is that the worst evenings are not the ones where I do nothing. They are the ones where I spend three hours being about to work. Doing nothing at all is restful. Being about to work is neither restful nor useful, and I did it for most of a year without ever counting it as time spent.

I am in Class IX now and none of this is solved. I miss days. What is different is that a missed day is a missed day, and not a sign that I was never serious in the first place. My sister is in Class XII and she told me she wishes somebody had told her this three years ago, which is the only reason I agreed to write it down.

One more thing, because my father read this before I sent it and said I should put it in. He asked me why I had never told him I was finding the year hard. I said I did not know it was allowed. That is not something he ever said to me. It is something I worked out on my own from somewhere, and I think a lot of us have worked out the same thing on our own.

So if you are a parent reading this, that is the only useful thing I have. Your child may have decided something about what she is allowed to bring home, and you may not have said it, and she may be completely wrong. But she will not find that out unless somebody says so out loud.

WHAT I WOULD TELL A CLASS VIII STUDENT

My sister says I should not give advice because I have only worked this out recently and I will probably change my mind. That is fair. So this is not advice, it is only the three things I would have found useful a year ago.

The first is that a plan you have not started is not progress. I spent whole evenings making mine look better and counted those evenings as work. Nobody ever told me they were not, and I think I knew.

The second is that the subject you avoid is the subject you are behind in, and the gap gets bigger every week you avoid it. Mine was chemistry. I left it until last every single day for a year, which means I did it almost never, and then I was surprised in February.

The third is the one I keep having to relearn. A day you miss is a day you missed. It is not proof of anything about you. I have missed four days this month and I am still going, which last year would have been impossible, because last year the fourth missed day would have ended the whole thing.

WHY WE PRINT THESE PAGES

A magazine written entirely by adults about what young people experience is always at risk of a particular failure: it can be accurate and still sound like a report filed from outside. These two pages are the correction, and they are the only two in the issue we cannot write ourselves.

What we ask for is not a school essay and not advice. It is an account of one thing that happened - a specific week, a specific conversation, an evening that did not go the way it was supposed to. Eight hundred words, first person. We do not correct the voice out of a piece before printing it, and we do not show it to anybody's school first.

You do not need a success to write about. The pieces we most want are about things that did not work, because those are the ones other students recognise, and because every published account of a success has already been edited into something nobody's life resembles.

And if it helps to have a question to answer rather than a blank page: what is something you believe about yourself now that you did not believe two years ago, and what happened in between? Most students clear the bar the moment they stop trying to write an essay about it.

The GenZ Times

Where Generations Connect.

OCTOBER 2026 · THE PSYCHOLOGY OF MOTIVATION

“If the feeling never comes, do you begin anyway?”

WHAT IS IN THIS ISSUE

WHY WE WANT TO CHANGE

The gap between wanting something and doing it.

MARKS, MONEY OR MEANING?

What is left when the reward is taken away.

THE CONFIDENCE ENGINE

Self-belief is made of evidence, and nothing else.

WHY TOMORROW LOOKS BETTER

The psychology of putting off what you care about.

WHEN MOTIVATION DIES

Two students, one mark, and the sentence that decides.

IN THE NEXT ISSUE

What a student should be moving towards: the skills that survive the next decade, why readers are pulling further ahead, and what employers in Hyderabad actually test for.
